Executive Summary

As directed under provisions of Senate Joint Resolution 67, adopted during the 2009 regular session of the Kentucky General Assembly, the Kentucky Geological Survey solicited data describing lands within the Commonwealth owned by State agencies and public universities. These data were compiled into an inventory and a geographic information system analysis was used to determine the potential for oil and gas resources underlying each tract. Data verifying the ownership of the mineral estate associated with a particular tract were not collected and such a determination was beyond the scope of this project.

A total of 931 parcels owned by 30 State agencies and nine universities comprising a total of 337,382 acres were assessed. These parcels were classified based on a determination of likely surface access restrictions and the potential for oil and gas resources. Surface access was divided into four classes: restricted, possibly restricted, tract too small or within an urban or residential area, and no known restrictions. A tract smaller than 23 acres was deemed too small to ensure compliance with gas well-spacing regulations specified in KRS 353 (1,000 feet between wells). Residential and urban areas were determined using publicly available GIS data for city limits, incorporated boundaries, and urban service areas. Note that surface-access restrictions do not necessarily condemn a tract from having oil and gas resources that could generate future revenue. Pooling of tracts and horizontal well-drilling technology provide opportunities for oil and gas recovery even when no drilling is allowed on the surface of a property.

Oil and gas resource potential was classified into one of three categories based on proximity to production from known wells: no oil or gas, oil or gas wells within 1 mile or tract is underlain by continuous reservoirs, production is demonstrated on the tract by the presence of oil and gas wells. A continuous reservoir is an unconventional (usually) gas resource, such as organic-rich black shales and coals (coalbed methane), where resource recovery is more a function of technology, infrastructure, and commodity price rather than the presence of a discrete accumulation of oil or gas. The 1-mile limit is a commonly adopted heuristic indicating a distance in which any wells drilled more than 1 mile from existing production are considered to be “wildcat” wells with an increased risk of drilling a nonproducing well. The designation “no oil or gas” simply means that no known production is within a mile of the parcel and it is not underlain by a continuous reservoir. Future technology and economics may lead to discoveries suggesting resources associated with the tracts excluded in this assessment.

The median (50th percentile) volume of oil or gas from a typical Kentucky well was determined using recent wells with at least 5 years of production. The average daily production over the first 5 years was multiplied by a recent commodity price (Henry Hub for natural gas and West Texas Intermediate for crude oil) to determine the value of production. An arbitrary price range was selected to represent possible price fluctuations. Finally, it was assumed the State or university would receive proceeds from two revenue streams: the standard one-eighth (12.5 percent) royalty paid to the owner of the mineral estate (expected to be exempt from severance tax) and a 4.5 percent severance tax on the net revenue after deduction of the royalty paid to the mineral estate owner.

Findings

- 1) Recoverable oil and gas resources are expected to occur on many State- and university-owned lands.
- 2) For the purpose of this assessment, State or university ownership of the oil and gas mineral estate associated with a particular surface tract is assumed.
- 3) The value of any oil or gas on a State- or university-owned surface tract in this report is an estimate based on a reasonable assessment of the presence of oil or gas at current market conditions and should not be used as a basis to establish the market value of that mineral estate.
- 4) Price volatility, long-term land management and stewardship policies, sensitive environmental conditions, and the unknown nature of any proposed resource development planning make any estimate of the value of future oil and gas resources speculative, at best.
- 5) Surface access is expected to be restricted in the case of parks, nature preserves, lakes, dams, wild and rivers. The designation for a particular tract was a judgment call by us for the purpose of this assessment and is not intended to reflect existing management plans or dictate future policy.
- 6) Many State- or university-owned tracts are either too small to support oil and gas drilling and production activities or are in urban or residential areas and were excluded from valuation calculations.
- 7) Designation of a tract as having restricted surface access, limited size, or being in an urban or residential area does not necessarily preclude recovery of available resources. Pooling tracts into oil and gas development units and horizontal drilling may be used to recover resources in these cases.
- 8) Wells drilled on State- or university-owned lands are most likely to be gas wells drilled in eastern Kentucky.
- 9) A standard well spacing of 23 acres was assumed, based on the spacing between producing gas wells mandated by KRS 353.
- 10) The most likely scenario suggests revenue between \$30 million and \$77 million over 5 years assuming all possible wells are drilled (50 percent of available well locations) and those wells are completed at a 30 percent success rate.

Impediments to this Analysis

- No data standards for digital spatial property management and identification.
 - The same property may be listed multiple times by various agencies, but different naming conventions and alternate boundary definitions preclude positive identification of duplicates.
 - Publicly available data does not necessarily match data maintained internally by a reporting agency (tract acquisition, transfers among State agencies, and trades with private interests).
 - Reported parcel size does not necessarily match property size calculated using GIS methods (suggests problem with or changes to tract boundary definitions).
 - Some digital data are not in a standard georeferenced format (i.e., AutoCAD drawings).
- Not all data are available digitally. Location data must be approximated for physical addresses, images of plat maps, meets and bounds deed descriptions, and tract acreage.

Suggested Improvements

- Reported ranges of potential revenue are based on assumptions not likely to occur simultaneously. For example, all wells will not be low-volume, generating revenue at the lowest expected price. A Monte Carlo simulation (repeated random sampling) using given boundary conditions and allowing well performance and revenue to vary across those conditions would provide a more realistic projection.
- Modeling expected well types (oil, gas, deep) and their variant spacing by reservoir and producing area would yield a more realistic assessment of potential developed area and resource magnitude.
- Production and reservoir data could be used to determine estimated ultimate recovery for oil or gas by reservoir within a producing area. Publicly available data for this kind of assessment are sparse to nonexistent, but could be used to improve the estimates.

Senate Joint Resolution 67: Assessing Oil and Gas Potential of State- and University-Owned Lands in Kentucky

Introduction

On March 20, 2009, Kentucky Gov. Steve Beshear signed Senate Joint Resolution 67 (SJR-67) “direct[ing] the Kentucky Department of Energy Development and Independence to enter into a memorandum of agreement with Kentucky Geological Survey to study the value of potential oil and gas operations on State-owned and university-owned lands and to identify factors that may limit development of such a program” (Appendix A). This report presents the results of that study.

Kentucky’s oil and gas industry can be traced to 1815, when a well drilled to recover brine for salt-making encountered oil and was abandoned (Jillson, 1952). Historic records indicate Kentucky has produced 782 million barrels of oil and 5.7 trillion cubic feet of natural gas (Figure 1). Most Kentucky production is from the eastern and western regions of Kentucky that include the coal fields and the southern portion of central Kentucky (Figure 2). Approximately 98 percent of the state’s natural gas production is from eastern Kentucky and an estimated 75 percent of natural gas is produced from the Devonian Ohio black shale. Oil production in Kentucky is from three general areas: western Kentucky which produces 39 percent; south-central Kentucky which produces 17 percent; and eastern Kentucky which produces 44 percent. Most of Kentucky’s wells are “stripper” wells with average daily production of 10 barrels of oil (Bo) or 60 thousand cubic feet (Mcf) of natural gas or less.

Methods and Definitions

Conventional oil and gas production occurs from discrete underground accumulations. Unconventional production occurs from continuous reservoirs that are potentially productive over large regions. Kentucky’s oil and gas wells were divided by geologic age into 8 groups: two unconventional reservoirs (coalbed methane and the Devonian black shales) and six conventional reservoirs (Table 1). These reservoir groups have been summarized to provide a single indicator of whether there are multiple producing zones on a tract or how close that tract is to known production.

Some tracts were deemed too small (less than 23 acres) for full analysis and others were excluded because they were in corporate city limits. The 23-acre limit is based on the legally mandated (KRS 353) spacing between producing gas wells (1,000 feet). Spacing for oil wells (about 4 acres) and deep wells (up to 169 acres) should be considered, but such modeling would require software development beyond the scope of this project.

Data Acquisition

To assess the potential oil and natural gas resources on State- and university-owned properties, the Kentucky Geological Survey at the University of Kentucky identified agencies that own or manage State and university lands, and solicited digital data sets compatible with geographic information system software. Data accepted included georeferenced map data (ESRI shapefiles), AutoCAD drawings, plats, deeds, and address locations.

- State-owned facility information was received from the Department for Facilities and Support Services (Division of Real Properties, Kentucky Finance and Administration Cabinet) in the form of an “official” list (i.e., an inventory summary). These data served as a starting point for data collection.
- Publicly available data sets were downloaded from the State’s Geospatial Data Clearinghouse on the web at the Kentucky Geography Network (kygeonet.ky.gov). These data included various georeferenced and compiled statewide data sets.
- As data were received from agencies, they were checked for location accuracy and cross-referenced with the official inventory. Data received or downloaded in the form of shapefiles were for the most part used as is. Some agencies took the data solicitation as an opportunity to supply updated tract and ownership information, however. Boundary and tract data differences were resolved to the extent possible, given the time constraints for the project.
- Some data sets included privately held parcels (the Nature Conservancy, and other organizations). These properties not owned by the State were excluded from analysis. University lands included information on multiple adjacent parcels around each campus were consolidated to a single outline or campus footprint where possible. Multitract parcels for university research forests and wildlife management areas were left intact.
- Selected information was extracted from AutoCAD drawings as vector files, which were in turn connected and converted to compatible shapefiles using standard GIS mapping procedures. In several instances, the drawing layer was not attributed as a property outline, but appeared to represent the maximum extent of the facility or property in question, and thus was selected as such. AutoCAD drawing data typically includes no projection information as required by GIS software and required further analysis to manipulate the final shapefiles into files with real-world coordinates.
- Data provided as physical addresses were processed to create initial point locations by using established GIS address coding (“geocoding”) techniques. These derived location data were checked and edited, as required, by comparing the derived data with high-resolution aerial photographs available from the online Commonwealth GIS base-map server, called KYGEONET (kygissserver.ky.gov/tcmbase/). Time permitting and after editing the corrected point location, an outline of appropriate acreage was digitized using heads-up estimation around the presumed facility. Where the property outline was indefinite or could not be determined, a circle with the area of the reported acreage centered on the geocoded address was drawn. Although this method of data-capture lacks the precision of georeferenced survey data, it represented the best available approximation of both the facility’s location and size. Geocoding address data is inaccurate if only a general mailing address was provided (e.g., post office box) or if the software

could not locate the street, road, or highway in question. In those cases, the software initially positioned the location to the center of the city in question, the center of its ZIPcode, or at the beginning point of the named street. There are few alternatives to resolve these locations.

- For deeds with plats, a location was estimated by digitizing georectified images of the plats. If only a deed was available, then an attempt was made to locate the tract using information available in the deed description. If a location could be resolved, an estimated boundary was digitized from aerial photography on the KYGEONET server. Following the meets and bounds descriptions or survey points provided on each deed was too labor-intensive; in these cases (as with address geocoding), only a general outline or circle of appropriate acreage was used to identify and characterize the facility in question.
- Following collection or creation of individual shapefiles, the facilities were compiled into discrete subsets according to their managing agency (i.e., forests, state parks, universities, Department of Military Affairs, Fish and Wildlife, nature preserves, Department of Corrections, etc.). This was necessary since many of the downloaded shapefiles contained feature attributes unique to each agency and a consolidation of all shapefiles into a master set would have been unwieldy.
- The attribute tables for each subset included most of the original downloaded items, but each facility record was edited to include a KGS identification number, an inventory number, and acreage calculated from the polygon tract data using GIS software. This identifier and acreage calculation helped facilitate cross-matching parcels reported by multiple agencies.

Caveats

In the process of data collection and compilation of State- and university-owned properties, it became apparent that accurate locations and updated shapefiles are a necessity. Furthermore, ownership, whether State or university, is constantly shifting. Street addresses for some community colleges, for instance, were found to be inaccurate or missing because of recent relocation of campus sites. Downloaded data for state parks, forests, and nature preserves were found to have updated property outlines that were not available on KYGEONET.

Assumptions had to be made about general outlines generated from deed or AutoCAD drawings. Not all locations initially provided on the Facilities and Support Services inventory list could be identified or matched to data reported by other agencies.

Some facility sites (e.g., Department of Corrections, Kentucky Community and Technical College System) were located easily through geocoding, but their property outlines could only be estimated. For these sites, a circle of appropriate acreage around each estimated location was adopted.

Cross-checking and inspection of geocoded data using online services was helpful, but incomplete, for narrowing down the location of a named facility. In some cases, such inspections provided further information and possible additional data for a facility's geometry or outline. Property boundary and acreage data derived from online base-map services should not be considered as reliable as surveyed and georeferenced data.

The reported data are incomplete. Kentucky Transportation Center right-of-way data and the boundaries of maintenance facilities are still being digitized and compiled by the Transportation Cabinet. Their data was accepted as is. These right-of-way and maintenance facility data were excluded from the assessment on the basis of size, use, and surface access. These properties may become subject to pooling with other tracts, however.

Disclaimer

A good-faith effort was made to capture a general outline of facilities with incomplete or inadequate location data for analysis. Because of assumptions made and operations performed to generate the resulting shapefile data, a disclaimer is in order.

Digital data: The digital property data used in this study were compiled by the Kentucky Geological Survey at the University of Kentucky from data reported by State agencies and universities. Neither KGS nor any of its employees provide any warranty, expressed or implied, or assume any legal responsibility for the accuracy, completeness, or usefulness of any information, apparatus, product, or process disclosed herein or claim that its use would not infringe privately owned rights. The act of distribution does not constitute any such warranty, and no responsibility is assumed for the use of these data and related materials by other persons. Reference to any specific commercial product, process, or service by trade name, trademark, or manufacturer does not constitute or imply endorsement or recommendation by KGS.

Map data: Although this map was compiled from digital data that were successfully processed on a computer system at KGS, no warranty, expressed or implied, is made by KGS regarding the utility of the data on any other system, nor shall the act of distribution constitute any such warranty. KGS does not guarantee this map or digital data to be free of errors or inaccuracies. KGS disclaims any responsibility or liability for interpretations from this map or digital data, or decisions based thereon.

The Assessment Framework

Table 2 summarizes the conditions considered when assessing potential oil and gas resources on State- and university-owned lands. In general, parcels were scored based on the likelihood of surface access restrictions and whether a potential for oil and gas resources was indicated or demonstrated. Tracts were assessed with no access, limited access, or with no immediately apparent restrictions on surface access. Surface-access restrictions were assumed by KGS staff based on the best available information on land use. For example, state parks and nature preserves were assumed to be subject to surface-access restrictions. Multiuse forests, wildlife management areas, and other tracts where resources have been extracted in the past are assumed to have negotiable surface access for the purpose of this assessment unless excluded by the agency reporting ownership. Rows and columns in the framework were assigned values so that each cell could be assigned a score equal to the sum of the row and column scores. Tracts with surface-access restrictions and no indication of oil or gas resources received low assessment scores. Tracts scored with no surface access are state parks, nature preserves, wild rivers, lakes, dams, wetlands, and Maxey Flats. Resources underlying tracts with no surface access or limited surface access may remain subject to leasing and recovery through the use of existing pooling provisions and horizontal well drilling technology that would place surface disturbances outside of the parcel.

Some tracts were judged to have limited access; that is, there are no specific restrictions for drilling on the tract but because of its size or vicinity to urban or residential areas, multiple tracts would have to be pooled to meet Kentucky spacing guidelines. Tracts in urban or residential areas are indicated only because such tracts have become an issue in the development of continuous resource plays such as the Barnett Shale in the Fort Worth Basin, where urban drilling is taking place in Fort Worth, Texas.

Pooling is a legal designation allowing an operator to combine (pool) the mineral interests of separate owners and manage that unified tract as a single lease for the purpose of complying with oil and gas well spacing regulations. Royalty payments are proportionally allocated among the multiple ownership interests. Pooling provisions may include all or parts of a specific tract. Some State- or university-owned lands may become subject to forced pooling provisions.

Typical drilling is a conventional vertical well drilled to access oil or gas resources underlying a tract. Spacing provisions defined in KRS 353 and other regulations establish the minimum distance between producing wells and the minimum distance between a well and the tract boundaries with adjacent mineral interest owners. Waivers to the spacing regulations may be granted by the Kentucky Division of Oil and Gas Conservation in the case of twin wells and enhanced recovery projects. Deep well spacing units are established by administrative hearing. The establishment of deep well spacing units is the most likely scenario for forced pooling of State- or university-owned lands with private lands. The State or a university may be obligated to show cause why a particular tract of land should be exempted (or included) as part of a deep well spacing request.

Continuous resources such as the Devonian black shale (Ohio and New Albany Shales) and coalbed methane are likely to be developed via horizontal or intentionally deviated wellbores in which the target zone does not directly underlie the surface location. Horizontal wells may include multiple laterals or deviated wellbores drilled from the same surface location. In these cases, the surface location may not be on the State- or university owned tract, but a lease agreement must be in force to access those resources (that is, pooling).

Verification of State or university ownership or control of the mineral estate coincident with a surface tract is beyond the scope of this project. Should the mineral estate remain in the control of the private sector, the occasion may arise when access to resources underlying a tract cannot be legally prevented without acquiring those mineral rights at expense to the State or university. **The value of any oil or gas on a State- or university-owned tract in this report is an estimate based on a reasonable assessment of the presence of oil or gas and current market conditions and should not be used as a basis to establish the market value of that mineral estate.** Any revenue projection should require a detailed evaluation of the volume of oil or gas in place and its value, and a study should be commissioned for the tract(s) in question.

The Value of Kentucky Wells

A traditional assessment of the value of oil and gas resources on a particular tract determines reservoir area, thickness, and porosity; oil, gas, and water saturations; and an estimation of original oil in place, produced oil or gas volumes, recovery factors, and ultimate recovery. For a survey project of this scale,

lack of data, resources, and time preclude such a detailed assessment. In addition, the large number of State- and university-owned tracts whose exact location and size were not adequately known preclude a detailed and comprehensive analysis.

The approach used for this study was to determine a range of revenue projections for single wells based on publicly available production data and commodity prices. Oil and gas production data by well have been collected since 1997 by the Kentucky Division of Oil and Gas Conservation. These data are available online and are available from both the Division and Kentucky Geological Survey Web sites. Production for wells completed since 1997 that include at least 60 months of data were extracted from the data set, and the 5-year cumulative production volume was compiled. A 5-year operational history was chosen to be representative of long-term performance, including the possibility of shut-in and other curtailment periods. Figure 11 (gas) and Figure 12 (oil) show the cumulative (log normal) distribution of the average daily production from the first 5 years of a well's operation. For example, 25 percent of Kentucky gas wells average less than 15.1 thousand cubic feet of gas per day (Mcf/d) over the first 5 years. Fifty percent of gas wells average between 15.1 and 51.8 Mcfd. Only 25 percent of gas wells average more than 51.8 Mcfd over the first five years of operation. Table 3 shows an estimated range of projected revenue after 5 years for a single Kentucky oil or gas well at the 25th, 50th (median), and 75th percentile performance levels. The revenue stream includes both royalty (12.5 percent) and severance tax (4.5 percent) income and is illustrated at differing commodity prices. The "today" commodity price was the price reported for reference standard market centers (Henry Hub price for natural gas and the West Texas Intermediate price for oil) on November 23, 2009. For the purpose of this assessment, a "low" and "high" price are assumed to represent limits of the expected variation of the commodity price. Figure 13 shows the ranges of the expected royalty and severance tax revenue streams for a single well at low, median, and high commodity price ranges and production volumes.

Drilling and Production

Drilling activity and production trends provide a basis for determining the likely well completion (oil or gas) and the area across the state where the wells are most likely to be drilled. Figure 14 shows the history of permits issued since 2000 by region. Over this period, eastern Kentucky has had the most activity because companies have been pursuing natural gas produced from the Devonian shale (Figure 7). Total production in a region may be expressed as barrels of oil equivalents (Boe) where 1,000 cubic feet of natural gas equals 0.172 Boe on a Btu basis. Figure 15 shows the regional production as a percentage of total Boe produced versus the percentage of total permits issued by region. It is clear that eastern Kentucky activity and production exceeds that in the other two regions. It should be noted that in 2008 (as shown in Figure 14), the number of permits issued in eastern Kentucky decreased even as production increased slightly. In central Kentucky, the number of permits issued has increased dramatically, but in 2008 the production increased only slightly. For 2008 in western Kentucky, the production declined only slightly, whereas the drilling activity remained fairly constant.

Results

For the purpose of this assessment, State or university ownership of the oil and gas mineral estate associated with a particular surface tract was assumed. Commodity price variation, long-term land-management and stewardship policies, sensitive environmental conditions, and the unknown nature of any proposed resource development plan make any estimate of the value of future oil and gas resources speculative at best.

Recoverable oil and gas resources are expected on many State- and university-owned lands. A total of 931 State- and university-owned tracts (Table 4) were assessed, and of those 758 (81 percent) have no direct indication of oil and gas resources. Of 337,382 acres (Table 5), oil and gas resources are indicated on 181,074 acres (54 percent). Using a standard well location size of 23 acres, there are a maximum of 7,824 drillable locations (Table 6). Assuming that 50 percent of the locations are drilled with a 30 percent success rate, projected revenue over 5 years is \$30.44 million if all wells are completed as natural gas producers at a constant commodity price of \$3.09 per Mcf (Table 7). With the same assumptions for oil completions, projected revenue over 5 years is \$76.92 million at a constant commodity price of \$75.80 per barrel (Table 8). On the basis of an examination of regional production and drilling activity, the typical well drilled on State- and university-owned land is expected to be a gas well drilled in eastern Kentucky.

Several improvements could result in better assessments of oil and gas resources and would better support the design of management and resource development plans. First, a uniform data standard should be adopted for recording and representing State- and university-owned land data. Without such standard, the same property may be listed multiple times by various agencies but with different naming conventions and alternate boundary definitions. For this study, this circumstance precluded positive identification of duplicate properties in several instances. Without a central repository, tract acquisitions and transfers (both between administrative agencies and private concerns) are not always reflected in publicly available data.

Some digital data are not in a standard georeferenced format. Many parcel descriptions remain in paper formats with limited utility. AutoCAD drawings, scanned images of plat maps, meets and bounds deed descriptions, and other formats need to be processed into a standard georeferenced digital data set to facilitate management and planning.

Some time, data, and resource limitations were encountered in the assessment itself. Reported ranges of potential revenue were based on assumptions not likely to occur simultaneously. For example, all wells will not be low-volume producers generating revenue at the lowest expected price. Well completion types (oil, gas, deep) are expected to vary and their varied spacing by reservoir and producing area would yield a more realistic assessment of potential developed area and resource magnitude. Production and reservoir data could be used to determine estimated ultimate recovery for oil or gas by reservoirs within a producing area. Publicly available data (core analyses) for this kind of assessment are sparse, but available.

In short, a cell-based or similar Monte Carlo simulation with given boundary conditions that allows well completion type, development history, well performance, and revenue to vary across the full range of parameters would provide a more realistic projection and possible development scenarios.

Acknowledgments

Without the assistance of dedicated State and university employees, compiling the data required for this assessment would have been impossible. We especially want to acknowledge and thank the following for their help and patience: Charles Bush, Director, Division of Real Properties (Facilities and Support Services, Finance and Administration Cabinet); Greg Abernathy, Kentucky State Nature Preserves Commission (Energy and Environment Cabinet); Alex Thor, Kentucky Department of Parks (Division of Facilities Management); Gary Cloyd, System Director, Kentucky Community and Technical College System; and Will Holmes, Kentucky Transportation Cabinet.

Units and Conversions

Bbl or Bo: barrel(s) of oil (42 gallons per barrel)

Boe: barrel of oil equivalent on a Btu basis, 1 Mcf gas = 0.172 Boe

Bopd: barrels of oil per day

CBM: coalbed methane (natural gas produced from coal seams)

Mcf: thousand cubic feet of natural gas

Mcfd: thousand cubic feet of natural gas per day

Table 1. Reservoir group details for State-owned lands assessment.

Reservoir Group	Notes
Paleozoic (Figure 3)	General class of production where limited data are available; that is, the detailed data required to further characterize the producing zone are not available. This is often the case for historic wells drilled in the 1800's and early 1900's.
Pennsylvanian sands (Figure 4)	Primarily sandstone reservoirs present in the eastern and western coal fields.
Coalbed methane (CBM) (Figure 5)	A potential unconventional reservoir in the eastern and western coal fields referring to production of natural gas from coal seams. Important assessment factors are whether a tract is in the vicinity of known production, underlain by coal, or underlain by deep coals that may represent potential gas resource and sequestration intervals.
Mississippian (Figure 6)	Limestone and sandstone reservoirs of Mississippian age are a primary target of much modern drilling.
Devonian black shale (Figure 7)	An unconventional reservoir that is responsible for up to 75 percent of Kentucky's current natural gas production. Important assessment factors are whether a tract is in the vicinity of known production, underlain by coal, or underlain by deep coals that may represent potential gas resource and sequestration intervals.
Silurian-Devonian (Figure 8)	Silurian and Devonian reservoirs represent some of the largest accumulations of oil and gas in Kentucky. This category applies mostly to "Corniferous" production.
Ordovician (Figure 9)	These are generally Middle and Upper Ordovician porous or fractured reservoirs that overlie the Cambrian-Ordovician Knox Group.
Knox and deeper (Figure 10)	Reservoirs of the Cambrian-Ordovician Knox and deeper (older) strata.

Table 2. Framework for assessing the potential of oil or gas resources on State-owned lands showing range of scores assigned based on stated criteria (in parentheses).

Criteria	No O&G indicated (0)	O&G Potential (100)		O&G Demonstrated (200)	
	Wildcat area, no wells within 1 mile or dry holes only, and no potential continuous resource plays (Devonian shale, CBM)	Producing wells in vicinity (1 mile or less), or continuous resource plays Devonian shale: +10 underlies, +20 vicinity CBM, +1 deep coal underlies, +2 vicinity		Successful wells (even if not currently operated) exist on tract Devonian shale: +10 underlies, +20 vicinity CBM, +1 deep coal underlies, +2 vicinity	
	Drilling on Tract	Drilling on Tract	Conditions	Drilling on Tract	Conditions
No Known Surface Access Restrictions ¹ (3,000)	No (3,000)	Yes (3,100–3,122)	Pooling, conventional, horizontal	Yes (3,200–3,222)	Pooling, conventional, horizontal
Surface Access May Be Restricted ¹ (2,000)	No (2,000)	Limited (2,100–2,122)	Pooling, conventional, horizontal, surface location on tract or on adjoining tract	Limited (2,200–2,222)	Pooling, conventional, horizontal, surface location on tract or on adjoining tract
Acreage too Small to Meet Kentucky Spacing Guidelines (1,000)	No (1,000)	Limited (1,100–1,122)	Pooling, conventional, horizontal, surface location on tract or on adjoining tract	Limited (1,200–1,222)	Pooling, conventional, horizontal, surface location on tract or on adjoining tract
Urban/Residential Restrictions (1,000)	No (1,000)	Limited (1,100–1,122)	Pooling, conventional, horizontal, surface location on tract or on adjoining tract	Limited (1,200–1,222)	Pooling, conventional, horizontal, surface location on tract or on adjoining tract
Surface Access Restricted ¹ (0)	No (0)	No (100–122)	Pooling, horizontal (surface location outside tract)	No (200–222)	Pooling, horizontal (surface location outside tract)

¹Surface access restrictions are assumed by KGS staff based on the best available information on land use. For example, state parks and nature preserves are assumed to be subject to surface-access restrictions. Multiuse forests, wildlife management areas, and other tracts where resource extraction has occurred in the past are assumed to have negotiable surface access for the purpose of this assessment unless excluded by the agency reporting ownership.

Table 3. Range of revenue over 5 years to the State or university for royalty (12.5 percent) and severance tax (4.5 percent) for a single Kentucky natural gas or oil well illustrated at differing production volumes and commodity prices. "Today" commodity prices were reported for Henry Hub (gas) and West Texas Intermediate (oil) on November 23, 2009.

Gas			Total (Royalty + Severance)		
percentile	Avg Mcfd (5 yr)	Cumulative (5 yr)	Commodity Price		
			\$1.75 (low)	\$3.09 (today)	\$10.00 (high)
25 th	15	27569	\$7,930	\$14,003	\$45,316
50 th	28	51066	\$14,689	\$25,937	\$83,939
75 th	52	94590	\$27,209	\$48,044	\$155,482
Oil			Total (Royalty + Severance)		
percentile	Avg Bopd (5 yr)	Cumulative (5 yr)	Commodity Price		
			\$35.00 (low)	\$75.80 (today)	\$100.00 (high)
25 th	1	1995	\$11,477	\$24,856	\$32,792

Appendix A: Text of SJR-67

A JOINT RESOLUTION on development of State-owned oil and gas resources.

WHEREAS, there is an undetermined, but potentially significant, volume of natural gas and petroleum in formations beneath State-owned recreational and other public lands; and

WHEREAS, some general estimates have placed as much as a forty million dollar (\$40,000,000) annual value on those State-wide resources; and

WHEREAS, State-owned and university-owned recreational and other public lands are dedicated to and managed for an array of values and uses, some of which are more or less compatible with the surface disturbance, noise, and surface activities associated with oil and natural gas exploration, drilling, production, compression, and transmission; and

WHEREAS, on federal lands in the Commonwealth, oil and natural gas production activity has been undertaken for years, and the University of Kentucky has oil and gas operations outside the Commonwealth that provides needed revenues to that institution; and

WHEREAS, oil and gas production on State-owned lands occurs in states like Montana and the Dakotas, data from which can enhance the information from federal lands in the Commonwealth regarding the nature, extent, and mitigation of impacts; and

WHEREAS, the development of oil and gas reserves on certain lands, due to the sensitivities of those lands from a biological, historical, or cultural perspective may be controversial, steps can be taken to establish a permitting process that takes into account lands that are unsuitable for oil and gas development;

NOW, THEREFORE,

Be it resolved by the General Assembly of the Commonwealth of Kentucky:

➔Section 1. The General Assembly hereby directs the Department for Energy Development and Independence to enter into a memorandum of agreement with the Kentucky Geological Survey at the University of Kentucky to conduct research, either on its own or in collaboration with or under contract with other entities, to quantify the potential oil and natural gas resources on State-owned and university-owned properties. The study shall identify, in addition, factors that may limit development of those resources. The Kentucky Geological Survey, with the assistance of the Department for Energy Development and Independence, is directed to request information from Finance and Administration, various agencies that engage in state land acquisition including the state universities, on the whereabouts and ownership of the lands held by state universities and State-owned lands in the Commonwealth. The Finance and Administration Cabinet shall assist in the delineation of in-fee acquisitions held by the state where the state owns the subsurface estate.

➔Section 2. The Department for Energy Development and Independence shall develop a set of comprehensive conditions for a regulatory program to protect public safety and the environment for permitting oil and gas operations on State-owned and university owned lands in the Commonwealth. The program shall ensure that off-site disturbances to or interference with the purposes for which the lands are dedicated and managed would be minimized, including the protection of federal and state rare, threatened, and endangered species, avoiding damage to properties listed on the National Register of Historic Properties, and assuring compliance with air, waste, surface, and ground water laws and regulations, including state water quality standards. Additionally, the Department for Energy Development and Independence shall, with the assistance of The Finance and Administration Cabinet, develop model lease and oversight guidelines to assure that the undertaking of any oil and gas leasing would be conducted in accordance with state law.

➔Section 3. The Department for Energy Development and Independence shall report its findings to the Legislative Research Commission by December 1, 2009.

Appendix F: SJR-67, Assessing the Oil and Gas Potential of Kentucky Public Lands

This appendix is an oversized page (56 inches by 36 inches) requiring a large-format plotter to print at full size.

SJR-67: Assessing the Oil & Gas Potential of Kentucky Public Lands

Map compiled by: Brandon C. Nuttall, Tom Sparks, Sarah Briland
 Kentucky Geological Survey

EXPLANATION

Oil and Gas Wells

- Oil well
- Gas well

Data Layers

-  Corrections / Justice / Health facilities
-  KDFWR and WMA areas
-  Wild Rivers corridors
-  Kentucky National Guard facilities
-  Kentucky State Nature Preserves
-  KYTC properties
-  Kentucky State Parks
-  Kentucky State Forests
-  Black Mountain tracts
-  University / KCTCS properties
-  State Lakes
-  Federal Lakes (not evaluated)
-  Federal Lands (not evaluated)
-  Devonian Shale (deep and thick)
-  Devonian Shale outcrop or subcrop
