KENTUCKY COAL PRODUCTION: 1790 TO 1990

INTRODUCTION

Coal is Kentucky's principal energy resource and most important economic mineral. Data on coal production for Kentucky by year, county, and type of mining is vital information for planning. Coal-production data serve as economic indicators, and when compared with resource figures, provide useful information about future mining potential. The purpose of this report is to present coal production data for Kentucky by year, coal field, county, and type of mining from the earliest time that such data were reported.

The Kentucky Department of Mines and Minerals (KDMM) is the official State repository for coal-production records. The KDMM publishes an annual report that gives statistics on mining, mineral production, and mining-related labor in Kentucky. The annual reports of the KDMM are the basis for this publication, along with coal-production data from other sources. Unique to this publication are the cumulative totals for coal production from Kentucky since mining began to 1990, cumulative totals for each coal field, cumulative totals for counties, and cumulative totals by types of mining.

Data are presented by coal field, year, county, and type of mining. Mining type is categorized as undifferentiated (UNDIF.), underground (UNDR.), or surface (SURF.). Undifferentiated production represents the coal produced prior to 1922, and is considered to be from underground mining, the only significant type of mining of that time. Underground production includes slope, shaft, and drift mines. Surface production includes strip and auger mines. Estimated production is indicated by an asterisk (*).

Data for the period prior to 1886 are primarily from Eavenson (1942), and may not be as accurate as later figures. However, tonnages from this period are small compared to modern production. County production statistics for 1886 and 1888 were modified from Huddle and others (1963) and are only estimated. The report by Currens and Smith (1977) included a separate category called "Estimated Additional Production" that was added to yearly production totals. This category has been eliminated and the "estimated additional production" figures are not included in this report. The Annual Reports of the Kentucky Department of Mines and Minerals are the primary sources of production data for the years following 1884.

Errors in the Kentucky Department of Mines and Minerals Annual Report data have recently been identified. Data for the years 1948, 1950, and 1976 to 1990 have been corrected. Errors are typically the result of typographic mistakes, incorrect addition, location errors (wrong county), and duplicate entry of records. Tonnage figures for the above-mentioned years are now considered to be as accurate as possible. This publication may be updated in the future as records in the Mines and Minerals Information System data base are reviewed.

Coal production in Kentucky is from two separate coal fields: the Eastern Kentucky Coal Field, which is part of the Appalachian Coal Province, and the Western Kentucky Coal Field, which is part of the Eastern Interior Coal Province (Illinois Basin). Figure 1 shows both of Kentucky's coal fields with cumulative production summaries for counties in these regions. Figures 2 through 6 are

graphs that illustrate various aspects of Kentucky's coal production.

Kentucky has produced 6.6 billion tons of coal since 1790, 4.4 billion from the Eastern Kentucky Coal Field and 2.2 billion from the Western Kentucky Coal Field. Mining was almost exclusively by underground methods prior to World War II, at which time surface

mining became significant. Production from surface mining surpassed underground production in 1971. Since 1977 surface production has declined. Total production from surface mining is nearly equal between Eastern and Western Kentucky, 1.1 and 1.0 billion tons, respectively. Total underground production for eastern Kentucky is 3.4 billion tons and for Western Kentucky is 1.2 billion tons.
